Importing VFX Graph

These VFX were built using **Visual Effect Graph**. If you haven't already, go to "**Window -> Package Management -> Package Manager -> Unity Registry**". Search "**Visual Effect Graph**" and install it.

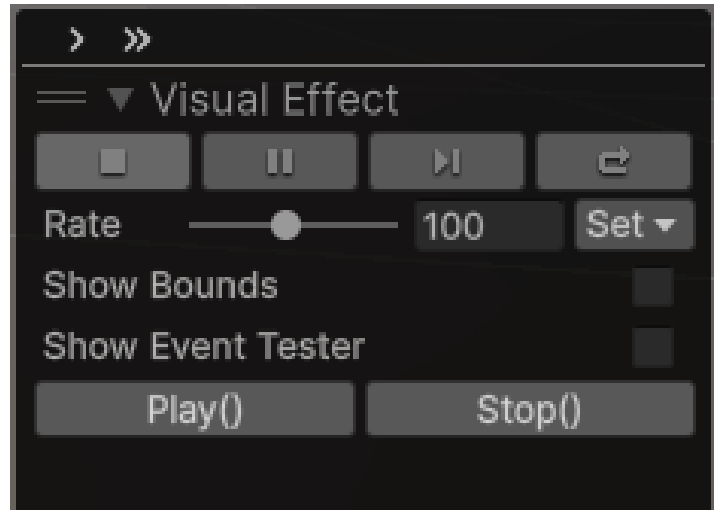

Technical Name	com.unity.visualeffectgraph
Minimum Editor Version	6000.4

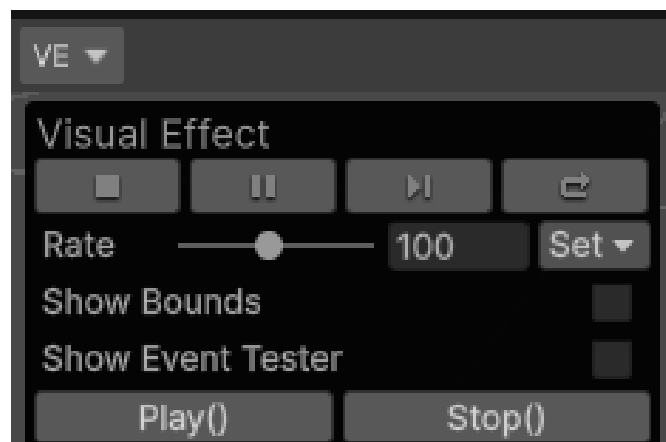

You'll also need a minimum editor version of **6000.4**.

Playing Slash VFX

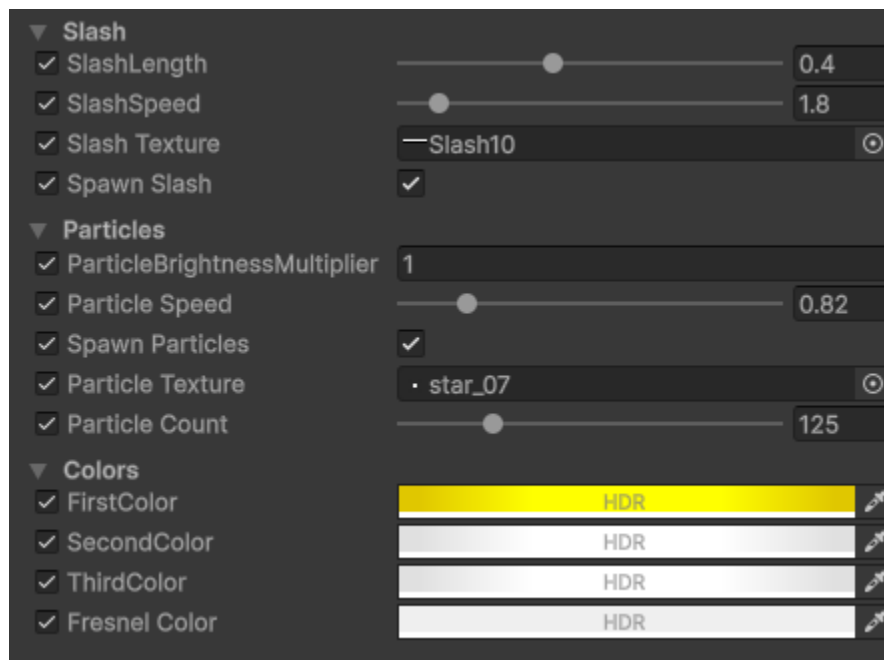

To play these in the scene window, select the **Slash_*** prefab you want and you should get a prompt which looks like this:

If you don't see it, look for the **VE** dropdown on the top:

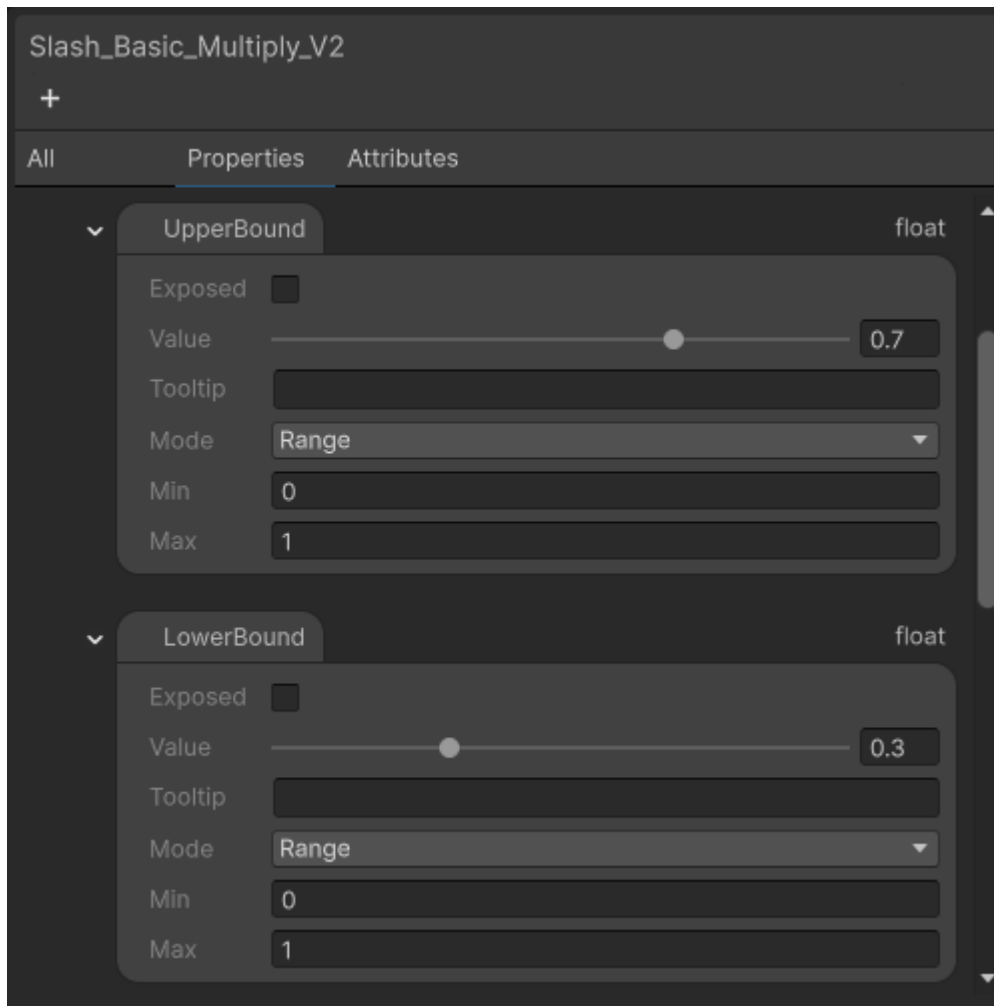

Adjusting Values

These are the adjustable values I set up. A few things to note:

- The coloring is based on the grayscale of the **Slash Texture**. The darkest values of the texture will use **First Color**. The lightest values will use **ThirdColor**. Anything in-between will use **SecondColor**. The Fresnel color is unaffected.
- This means not every slash texture will use every color. I.e., if a pure black texture was used on the image above, it would only use **FirstColor** (so yellow) and whatever the Fresnel color is.
- The bounds by default are between 0.3 and 0.7. The bounds are NOT exposed by default, but if you wish to change them, go into the Visual Effect Asset of the slash you wish to edit, look for **UpperBound** and **LowerBound**,

and check **Exposed**. This will make them appear alongside the other adjustable properties.

- The particle colors are also unaffected by the bounds.
- The particle textures of the **Slash_Flipbook_*** versions are set up to use flipbooks of certain grid dimensions. I don't recommend changing those unless you know how **Visual Effect Graph** works.
